

Mean impact of adding each source, by target graph

NM 3-shot / 30-way · matched step 40k · cell = mean Δ AUC (rung with the source – rung just below) over that source's measurable additions (n=3 orders; n=2 where it opened an order — a rung-1 entry has no 'before') · boxed diagonal = the newcomer's own entry boost
split panels = the same events restricted by the target's role at the step (tiny corner number = n; · = no such event) · the out-of-mix positives are order-C headroom recovery, not donor-specific transfer (see order_heldout_headroom)
