

Error of the best-donor predictor over the whole ladder

pred(mix, target) = max over in-mix sources of the single-source transfer — one formula for both roles (the matrix diagonal dominates every column) · zero fitted parameters
scored on the 18 distinct mixes × 8 targets at merge size ≥ 2 (shared rungs counted once; rung-1 models are the specialists themselves) · 1 seed

every unique ladder cell vs the zero-parameter rule

the max rule vs alternatives
