

Different targets expose different bottlenecks

Frozen checkpoints, verified input alignment, support-only probes, and a second episode stream.

What this does—and does not—show

○ Original episodes ● Fresh episodes

Each stream: 128 binary 10-shot episodes.
Probe fitting uses episode supports only.

* Best of nine specialists, chosen per stream:
an oracle summary, not a selection method.

† Metadata were not model inputs;
timing relative to suspension is unverified.

No training-seed or new-domain replication.
Available signal ≠ proof of model reliance.
